

# SplitStream

Real-time salary and subscription streaming in stablecoins on Solana

## The Problem & Our Solution

Freelancers and DAO contributors wait weeks for pay, while payers lack flexibility to adjust spend as work happens.

- Monthly payroll cycles delay cash flow for freelancers and DAO contributors
- Payers can't easily pause or adjust commitments mid-stream
- SplitStream streams stablecoins per second on Solana, withdrawable anytime
- Payers can pause, cancel, or top up streams instantly
- One simple dashboard shows real-time balances for both sides

# How It Works

Payers fund a stream, recipients watch balances grow in real time, and withdrawals or changes happen instantly on-chain.

- Payer creates and funds a stream with start/end time and rate per second
- Anchor program on Solana accrues balance continuously based on elapsed time
- Recipient withdraws accrued USDC anytime via Wallet Adapter
- Payer can pause, cancel, or top up the stream on demand
- Batch streaming lets payroll runs fund many recipients in one transaction

## Built with

Solana, Anchor, Rust, Next.js, Solana Pay, USDC SPL token, Wallet Adapter

# Why Now & What's Next

Stablecoin payroll is growing with remote and DAO work, and Solana's speed makes true per-second streaming practical.

- Remote and DAO work is rising, increasing demand for flexible payroll
- Solana's low fees and speed make per-second streaming cheap and real
- Next: invoicing and tax-reporting export tools
- Next: support for multiple stablecoins with FX auto-conversion
- Next: integrate with Realms and Squads for governance-approved payroll
